

Whenever you get an incoming call...

Easy Activation – The ringing menu

Up until today, when the phone rang, and we couldn't answer the call because we were in a meeting, cinema, etc., we could have only gazed at the device puzzled by who it was or what the caller wanted to tell us.

Today, the TWT solution offers us more options for answering calls, and in the most obvious way – when the phone rings, the new options appear in the new Ringing Menu.

Ready-to-use

The TWT solution requires no customization on the user side. Each user is supplied with a default ready-to-use response set, in a voice and language of the user's choice.

Responding with pre-recorded responses in the user's own voice

In order to respond with a personal and warm manner, users may pre-record responses in their own voice. Those recorded responses can be used as a Smart Reject or while the user is in a 'Silent Conversation'.

Pre-defined Text-to-Speech responses

Users may keep pre-customized Text-to-Speech responses, without the need to record those responses in their own voice.

Content Download portal - **Laughing 'till my belly hurts...**

Users can customize responses even further by using the response content download portal. Users can enrich their conversations with recordings of politicians, comedians, famous movie quotes or any other noises and sounds.

You don't always know what you are about **to say...**

As expected, not all responses may be predicted and pre-recorded, and sometimes it is required to compose an on-the-fly response. For those situations users may type the full text of their response, the same way they type SMS messages, and the TWT will convert the response to speech using Text-to-Speech technology. Users may select different voices and languages and may save the response for later use.

Politely reject incoming calls – using Smart Reject

Sometimes calls just can't be answered, however, the caller is too important for you to reject, or does not deserve such rudeness. Smart Reject is designed for those situations exactly. With just one click the device can answer the call, play a response that promises your attention later, and terminate the call.

Immediate 'Go2Chat' - switch from voice call to chat

Occasionally SMS is the user's preferred way of communication, but the caller can't predict that his voice call will be answered by text messaging.

Just for that there is the Go2Chat. The caller will hear a voice message stating the preference to converse by text messaging. Using an intuitive IM like interface the user can easily chat with the caller while keeping the conversation history on screen.

About Silent Communication Ltd.

Pioneers in the next generation of mobile call completion services, Silent Communication is an innovative company on the verge of changing the wireless market as we know it today. By deploying groundbreaking solution, Silent Communication has developed a VAS solution that, for the first time, allows voice communication in silence.
